CAS BI 594: TOPICS IN BIOLOGY: FUNCTIONAL GENOMICS
Prereq: CAS BI 552 or consent from instructor.

Recent years have seen an explosion in the number of organisms for which sequenced genomes are available. However, we are only beginning to understand how the information encoded in the million/billion DNA bases of eukaryotic genomes is organized and how that information is translated into function. Throughout this course, we will start to answer central questions in the molecular biology and functional genomics fields, including: Given that only ~2% of the genome encodes for proteins, what is the function of the rest of the genome? How is it possible that yeast, worms and humans have a similar number of genes? What is the flow of information in the cell that controls gene function and activity? Which experimental approaches allow us to tackle these questions?

CAS BI 445: CELLULAR AND MOLECULAR NEUROPHYSIOLOGY

Prereq: CAS BI 203 or CAS BI 315 or BI 325 or CAS NE 203 or consent of instructor.

Cellular and molecular basis of neural excitability and synaptic transmission. The molecular understanding of ion channels is extrapolated to higher brain functions such as learning, memory, and sleep. In the lab, we learn to obtain intracellular and extracellular recordings from muscle fibers and the third motor nerve of crayfish ventral nerve cord. The extracellular recordings allow us to monitor the network activity that controls the animal’s posture while the intracellular recordings allow us to investigate synaptic transmission. Quantitative analyses of experimental data will be performed. The entire class will contribute to a research project with the expectation that the data pooled from all students should be of sufficient quantity and quality for a publication.

CAS BI 542: NEUROETHOLOGY

Prereq: CAS BI 325, CAS NE 203, or CAS BI 563 or consent from instructor.

The purpose of this course is to link neurobiology to behavioral ecology and the sensory stimulus properties of the natural environment. We use a textbook in the first half of the course; in the second half we use student-generated research topics and develop these into multi-disciplinary team essays. Past topics have included courtship in bowerbirds and music frogs, and hunting in rattlesnakes and sharks. Lecture and discussion periods are devoted to student presentations and class discussions.

Prereq: BI 315 or BI 325 or NE 203 or consent of instructor.

An in-depth exploration of the neuroanatomical, neurochemical, neuroendocrine, and neurogenetic underpinnings of social behavior in animals. Detailed investigations of the mechanisms of social behavior will be studied within a broader framework of the evolution of sociality, in an attempt to understand how adaptation to group living has affected brain structure and function in both social vertebrates and invertebrates. Model and non-model organisms will be discussed, from ants to humans. Lectures are integrated with student-led discussions of relevant research papers.
