

Facile Activation of Carbon-Fluorine Bonds: Inner Sphere Construction of New Fluorinated Organic Ligands

Russell P. Hughes

Chemistry Department, Dartmouth College, 6128 Burke Laboratories, Hanover NH 03755

Activation of carbon-fluorine bonds, coupled with construction of new carbon-hydrogen and carbon-fluorine bonds, in the inner sphere of metals provides new routes to a variety of new fluorocarbon ligands. The bonding and reactivity of compounds containing fluorinated metal-carbon multiple bonds will also be discussed.
