

GETTING A PC IMAGE TO PROJECT

The most common method is to toggle the FUNCTION (“Fn”) key combined with the proper “F-Number Key” on your laptop.

Check for a small video monitor icon, or “CRT/LCD” usually in **blue**, along the top row of your keyboard.

OR

In **Windows 7** and beyond, you can also access the projector options by

pressing the Windows key  and “P”

GETTING AN APPLE IMAGE TO PROJECT

Connect the Mac to the VGA cable using the proper **Apple Video Adapter**, the image should automatically be sent to the projector after a few moments.

*If the image does **NOT** automatically appear*

TRY THIS

1. Once the Mac and projector are connected, click on  → **System Preferences** → **Display** → click on the “**DETECT DISPLAY**” button.
2. Under the **Arrangement** tab select the “**MIRROR DISPLAY**” box if you wish to have the image from the LCD projector match the one on you notebook’s desktop screen.
3. If the image looks odd on the screen, experiment with the resolution options in the **Display** tab until the image looks pleasing to your eye. A good resolution to start with is “**1024x768 @ 60Hz**”.
