Community Mobility Barriers Predict the Development of 30-Month Disability: The MOST Study

Boston University, University of Alabama-Birmingham, University of Iowa, University of California-San Francisco
What is the Environment’s Impact on Disability?
Disability Defined: Limitation in Personal and Social Role Behaviors

Theory: Disability results from the interaction of the person within their environment.
Institute of Medicine, 1991 & 1997
Determinants of Disability

Motivations, Coping, Attitude

Pathology/Impairments/Functional Limitations

Limitation in Personal and Social Role Behaviors (Nagi 1966, 1976, 1991)

Environment
Barriers (built environment, social attitudes) and Facilitators (attitude, support, products, tools, assistive devices, and accessible transportation) are Present

Gray et al. ; Noreau et al., 2002; Meyers et al., 2002; Shumway-Cook et al., 2002; Shumway-Cook et al., 2003
Community Mobility Barriers Reported by Older Adults in Birmingham, Alabama and Iowa

Keysor et al. 2010
Environmental Features Associated with Disability

- In adults with knee pain and/or functional limitations
  - Wilkie et al. 2007; Keysor et al. 2010, Clarke et al. 2005; Clarke et al. 2008

- In rehabilitation populations
  - Keysor et al. 2005; Whiteneck et al. 2004; Rochette et al. 2001

- No longitudinal studies
Purpose

- To examine whether mobility-related factors in the community environment were associated with the development of 30-month disability among older adults with functional limitations.
Research Hypotheses

1. Persons without disability at baseline who live in environments with more barriers will be more likely to develop incident disability at 30-months

2. Persons without disability at baseline who live in environments with more facilitators will be less likely to develop incident disability at 30-months
Methods: Recruitment Parent Study (MOST)

- Participants recruited from the Multicenter Osteoarthritis (MOST) Study
  - Prospective cohort study of community-dwelling adults age 50+ (N=3026)
  - Participants from Birmingham, Alabama and Iowa City, Iowa
Methods: Recruitment Ancillary Study

- MOST-Knee Pain and Disability (MOST-KPAD) Ancillary Study
  - Eligibility: Enrolled in MOST, age 65 or older, functionally limited (N=443)
  - Phone survey within 30 days of MOST clinic visit at baseline
Methods: Data

- Community mobility barriers and transportation facilitators (Home and Community Environment Scale (HACE))
  - MOST-KPAD baseline interview
- Disability: Late Life Disability Instrument- Instrumental Limitation Subscale
  - Baseline and 30-month follow-up
- Function (gait speed), pain, age, race, sex, education, body mass index, depressive symptoms, and clinic site
  - Baseline MOST clinic visit
Community Mobility Barriers and Transportation Facilitators (HACE)

To what extent does your local community have....

1. A lot or some uneven sidewalks or other walking areas
2. No parks & walking areas
3. No curbs with curb cuts
4. A lot or some public transportation that is close to your home
5. A lot or some handicap parking

Responses summed and dichotomized: Low vs. High Barriers
Low vs. High Facilitators

Keysor, Jette, & Haley (2005)
Outcome: Late-Life Disability Instrument (LLDI): Instrumental Limitations

(Scale 12 items; weighted score 0-100)

Disability: Outcome Variable

- LLDI Cut-points previously established for no, mild, moderate, and severe disability
  - Jette AM, Haley SM, Kooyoomjian 2002
    - Score $\geq 67.6$ No/Mild Disability = No Disability
    - Score $< 67.6$ Moderate/Severe Disability = Disability
Methods: Analyses

- Selected participants without disability at baseline
- Calculated the number of people who developed disability at 30-months
- Logistic regression
- Adjusted for age, sex, education, race, body mass index, knee pain, depressive symptoms, gait speed, and clinic site
- Sensitivity analyses to examine cut-point
3026 MOST Participants at Baseline

435 MOST-KPAD participants completed HACE

96 with disability at baseline

339 participants with No Disability at baseline

45 missing disability at follow-up

294 MOST-KPAD participants followed longitudinally

</tr>
</tbody>
</table>

* Adjusted age, sex, race, education, body mass index, knee pain, walking speed, and site
Conclusion

- Environments with more mobility barriers do seem to be a risk factor for incident disability

- Transportation facilitators seem to have a modest but not significant association with incident disability
Limitations

- Limited power to detect the relationships
- Did not adjust fully for other socioeconomical or psychological variables
  - Cannot completely rule out causality by other factors
Clinical Implications

- Community mobility barriers (and facilitators) are present and seem to have an important role in the development of disability (restricted participation/activity limitation)
- Need to discuss environment with our patients as a means to foster enhanced participation
- More research…policy change
