Recent years have seen an explosion in the number of organisms for which sequenced genomes are available. However, we are only beginning to understand how the information encoded in the million/billion DNA bases of eukaryotic genomes is organized and how that information is translated into function. Throughout this course, we will start to answer central questions in the molecular biology and functional genomics fields, including: Given that only ~2% of the genome encodes for proteins, what is the function of the rest of the genome? How is it possible that yeast, worms and humans have a similar number of genes? What is the flow of information in the cell that controls gene function and activity? Which experimental approaches allow us to tackle these questions?

CAS BI 394: TOPICS IN BIOLOGY:
NEUROTOXINS IN BIOLOGY, MEDICINE,
AGRICULTURE AND WAR
Prereq: BI108 or equivalent
In this course, we will use neurotoxins as a lens through which to learn neurobiology and physiology. Since most neurotoxins target synapses or ion channels, we will discuss the basic principles related to key steps of synaptic transmission and action potential generation. In the area of biology, we will discuss the toxin components of some venomous animals and discuss how these components are tailored to their specific hunting style. In medicine, we will seek to understand how the actions of certain neurotoxins have led to applications such as pain management or prevention of excitotoxicity. In the field of agriculture, we will study how the majority of pesticides are neurotoxins. Lastly, we will examine how neurotoxins have a long history of use as a tool to gain power during war times.

CAS BI 525: BIOLOGY OF NEURODEGENERATIVE DISEASES
Prereq: (CAS NE 102 or CAS BI 203) and (CAS NE 203 or CAS BI 325).
This course focuses on understanding the molecular mechanisms that are at the basis of neurodegenerative diseases and on their impact and relevance in clinical diagnosis and treatment. Neurodegenerative diseases like Alzheimer’s disease, Parkinson’s disease, Amyotrophic Lateral Sclerosis, Huntington’s Disease and Cruetzfeldt-Jakob disease are becoming more and more common since people are more exposed to pathogenic agents (as in Cruetzfeldt-Jakob disease and Mad Cow disease) or just encounter these diseases as a result of aging (like Alzheimer’s or Parkinson’s disease). Although very different from one another, these diseases share common mechanisms and features leading to neuronal death, including protein misfolding and aggregation, oxidative stress, impaired protein degradation, and apoptosis. This course will study how these molecular pathways define each disease, contributing to neurodegenerative phenomena. Relevance will be given to Alzheimer’s disease.
