Introduction

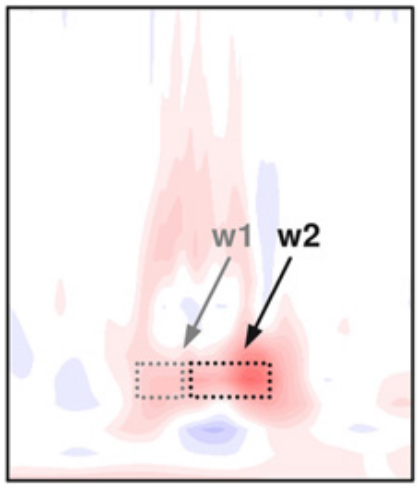
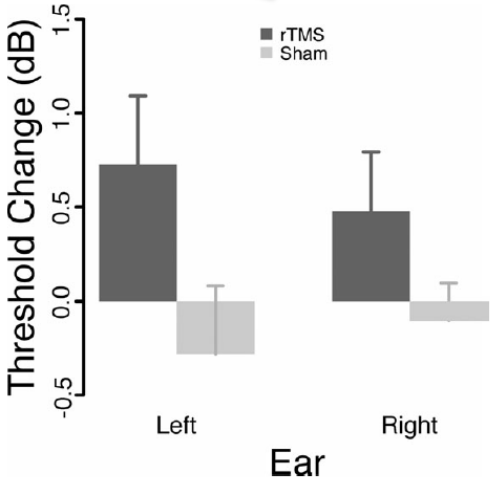
TMS



Oscillations



Behavior

Questions

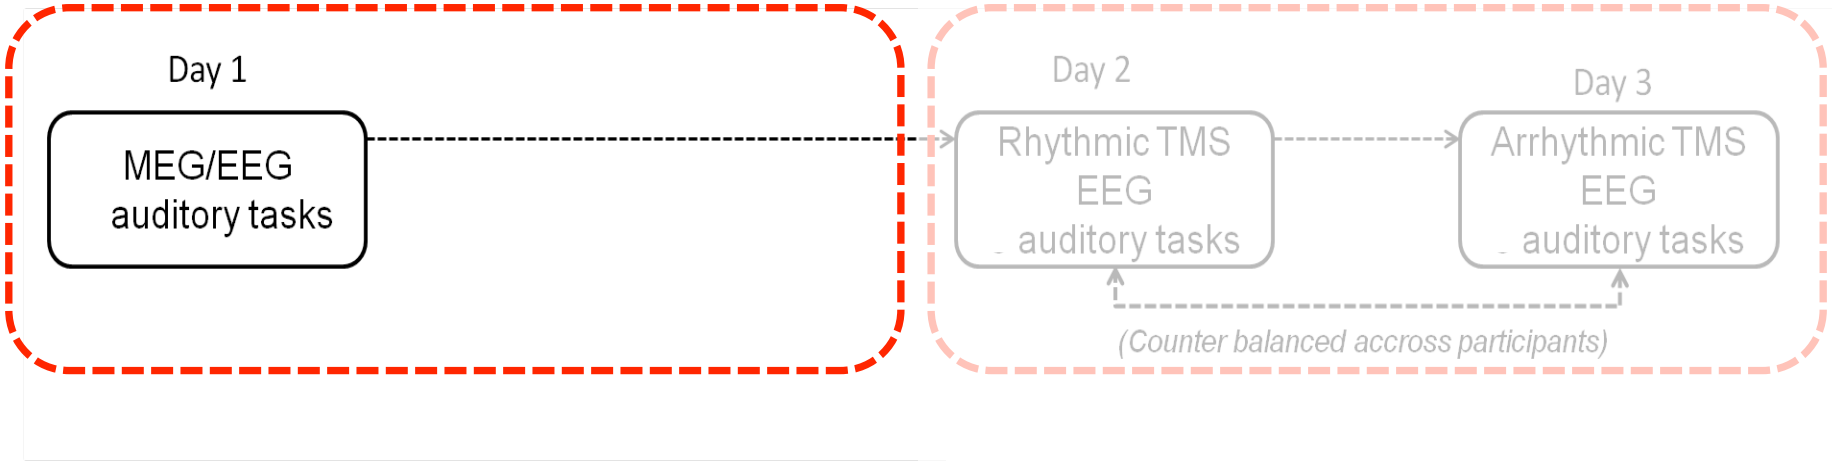
How a functionally relevant periodic stimulation applied over specific nodes of the auditory network during auditory processing can …

1) causally influence the activity of the auditory network

2) causally influence connectivity patterns of the auditory network

3) affect participants' behavioral performance (accuracy, RTs)

Protocol



Region to be targeted with rTMS

Frequency of the stimulation

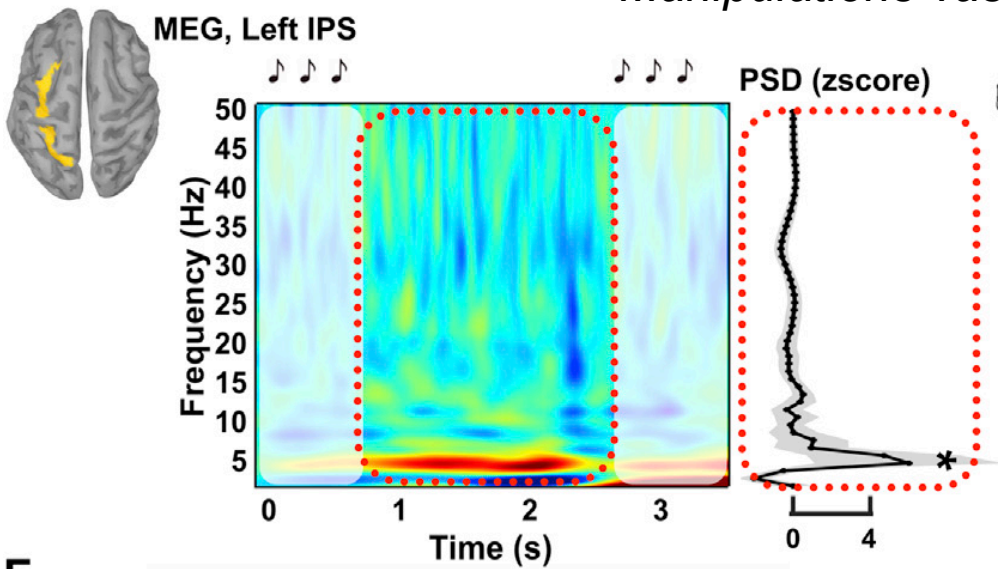
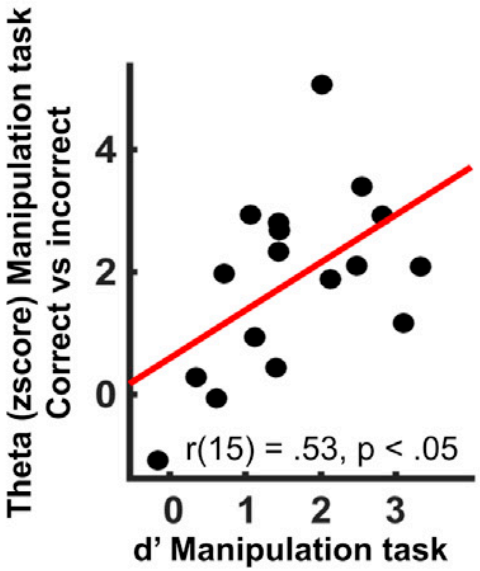
Left Fronto Parietal Pathway involved in the Manipulation of Auditory Information

rTMS to boost Working Memory specifically

Manipulation vs Simple

Correct vs Incorrect trials
Manipulations Task

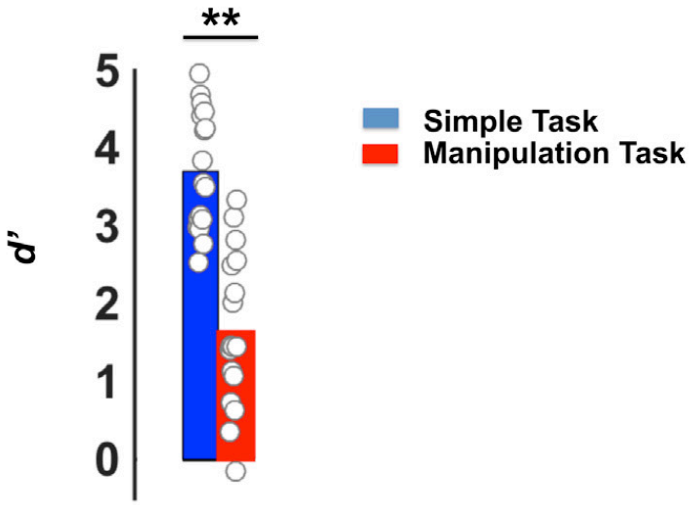




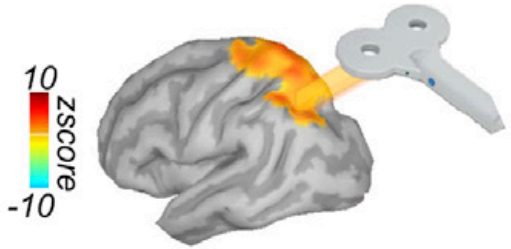
Theta power in the dorsal pathway during the retention period predicts participants manipulation abilities

Conclusion phase 1

Performance

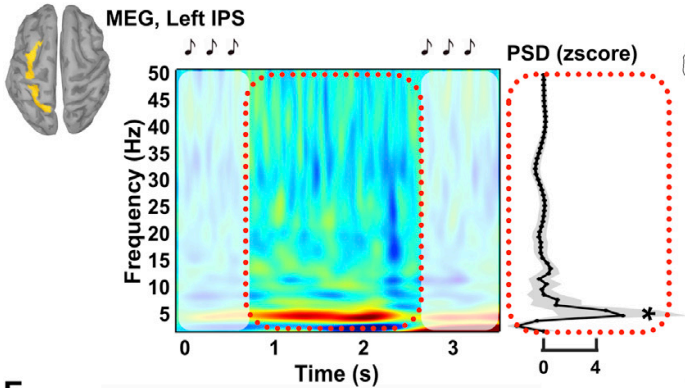


Target region

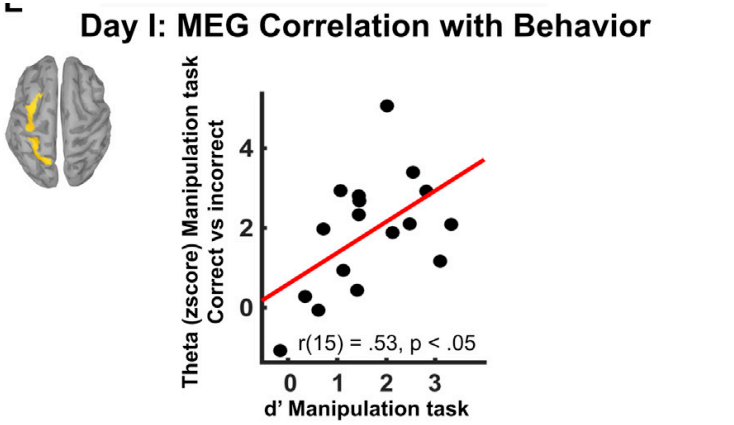


TMS at Theta Frequency

Frequency of stimulation



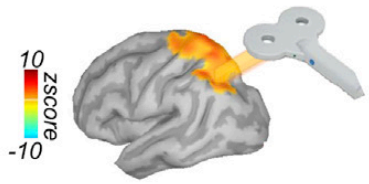
Link with behavior



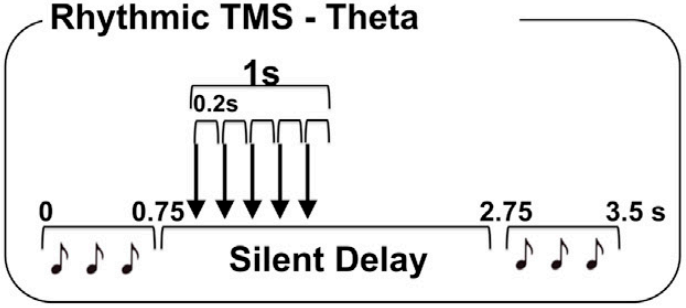
rTMS boosts Manipulation specifically

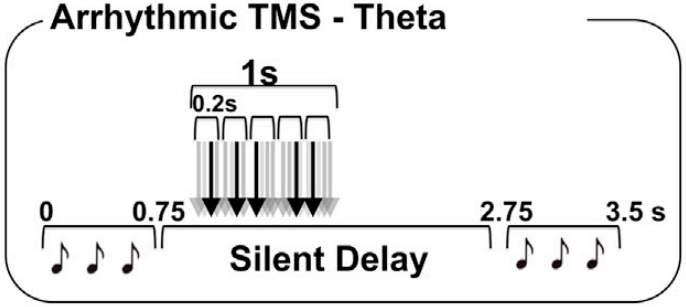
A

TMS Protocol

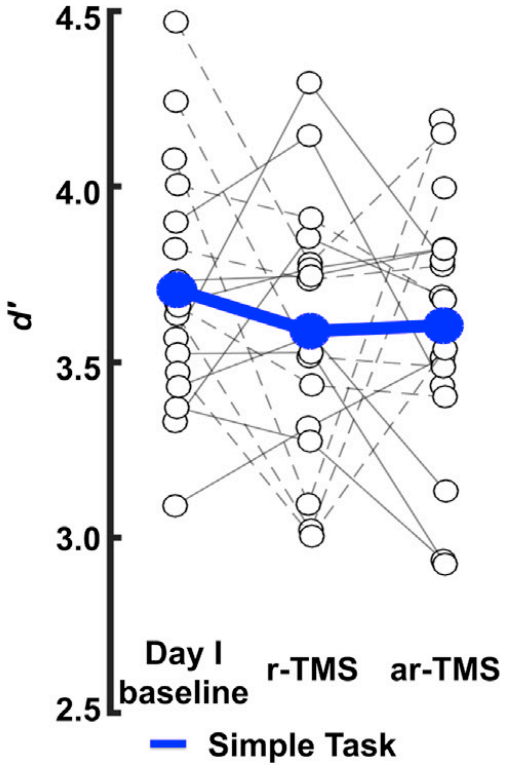


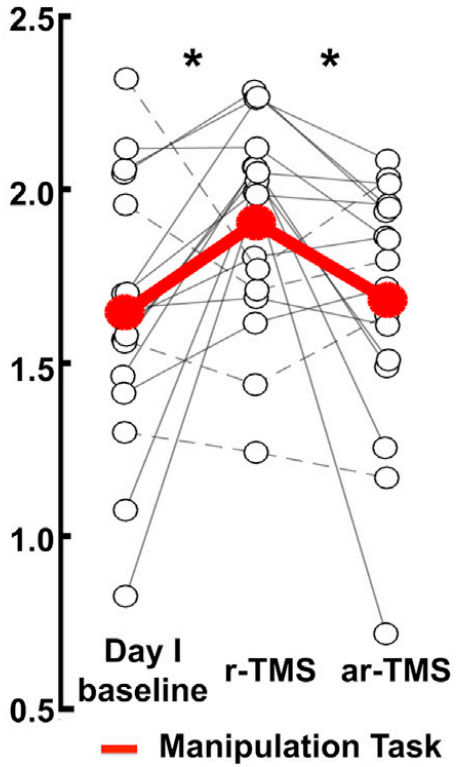
TMS at Theta Frequency



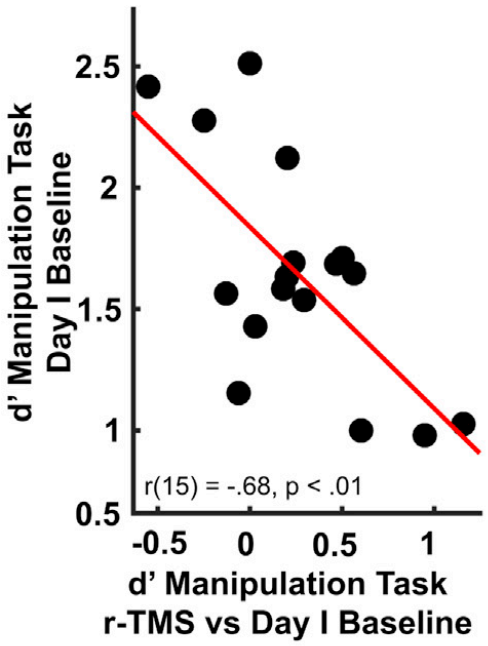


Behavioral Performance

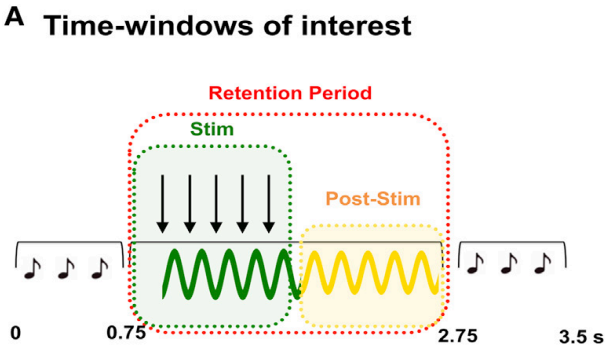




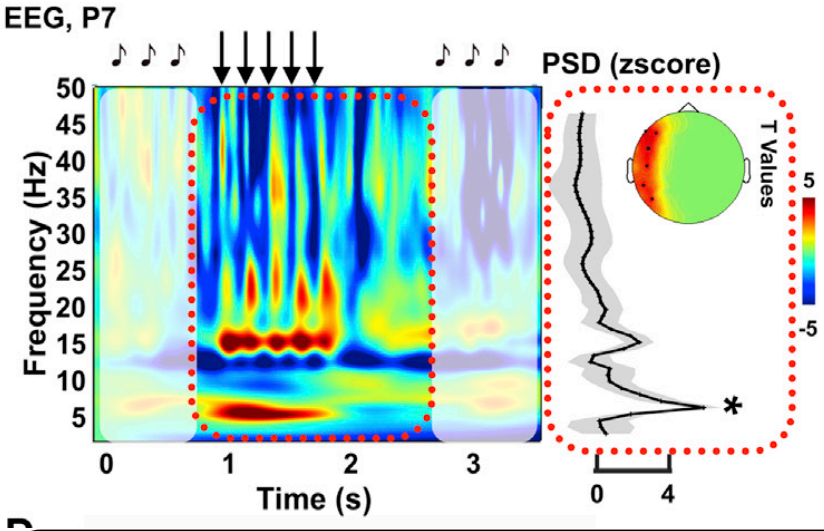
Correlation with Enhancement

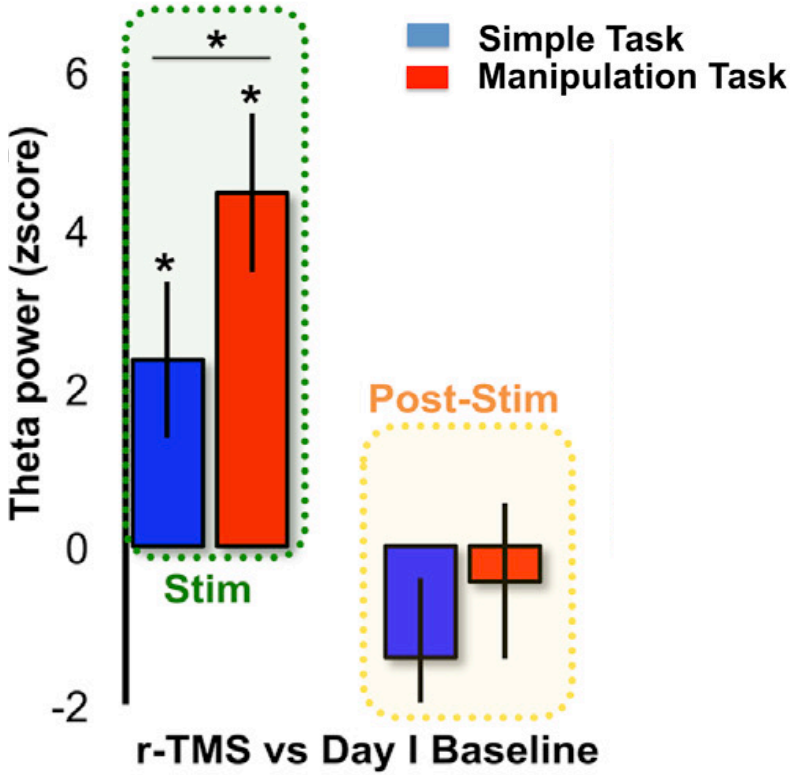


rTMS boosts ongoing oscillations



rTMS vs Baseline *rTMS vs ar-TMS*

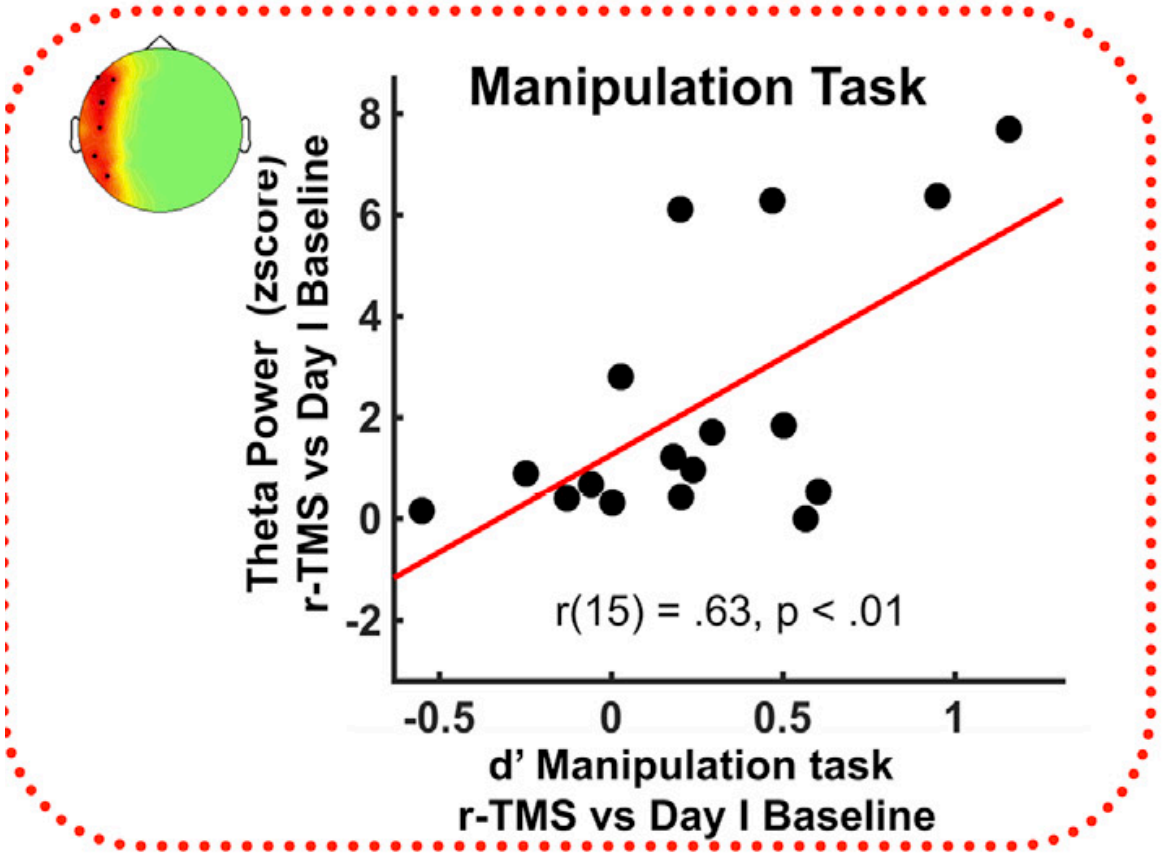




Entrainment is Task specific, but is efficient only during the stimulation time period

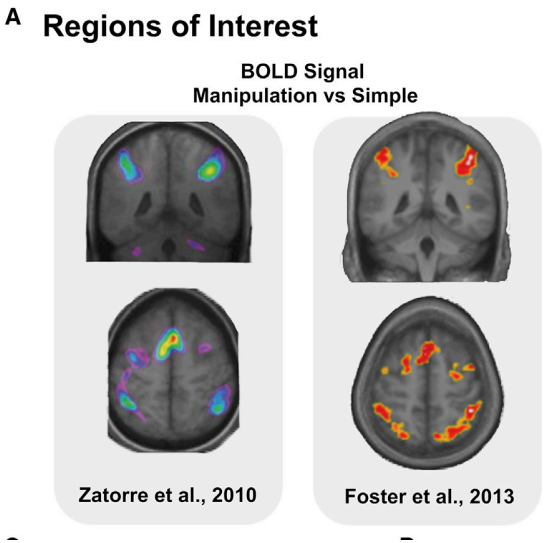
rTMS boosts ongoing oscillations

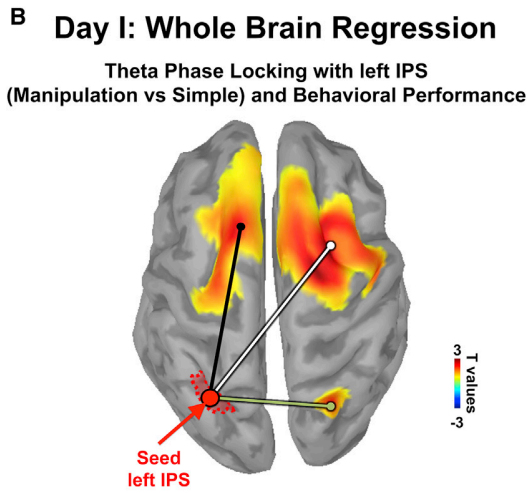
Correlation with Behavioral Enhancement

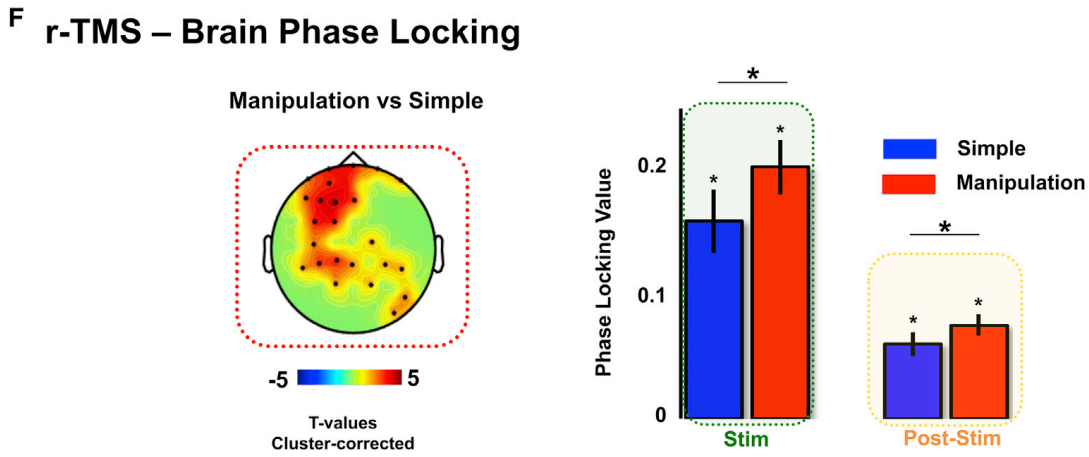


TMS-induced behavioral enhancement is causally related to theta entrainment

Functional connectivity patterns







Phase locking is Task specific, and is efficient during both stimulation and post stimulation time periods

Conclusions

Rhythmic TMS at theta boosts specifically participants performance on the inverted task

No behavioral modulation for the control task or arrhythmic stimulation

Rhythmic TMS boosts ongoing oscillations

Theta power entrained with TMS predicts behavioral benefits

Perspectives

Long term effects of the stimulation

Impact of non information based stimulation on behavioral training *(Venerio et al., 2015)*

Impact of such tools on cognitive disabilities impacting memory

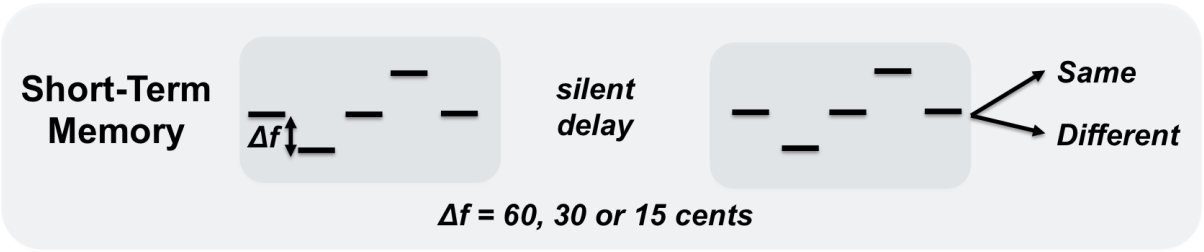
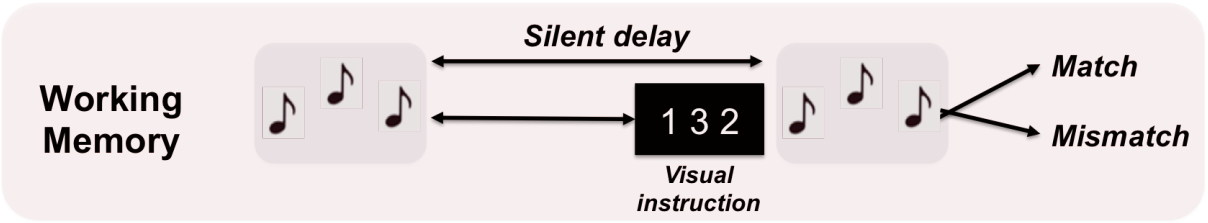
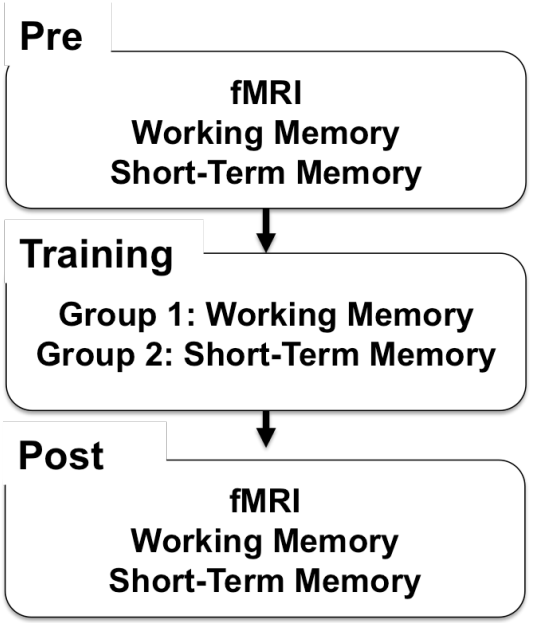
Behavioral training: Working vs Short-term memory

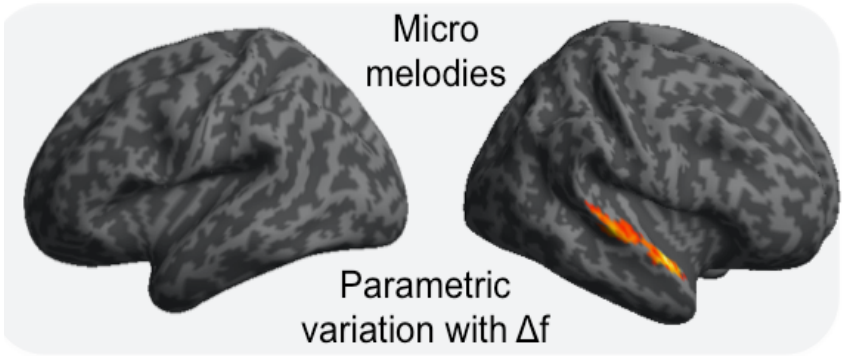


Micromelodies: Zatorre et al., 2012

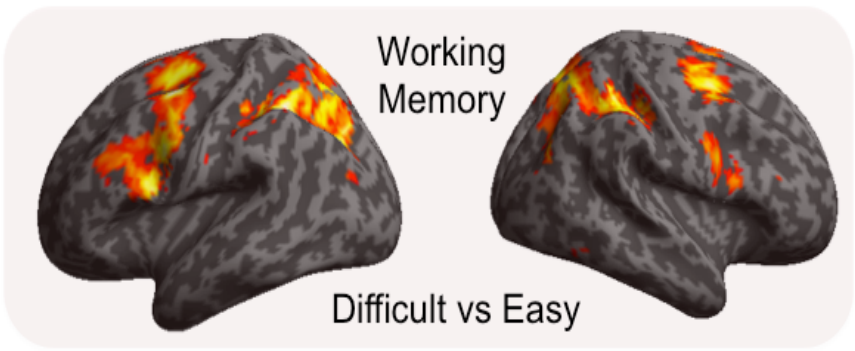




Short-Term Memory

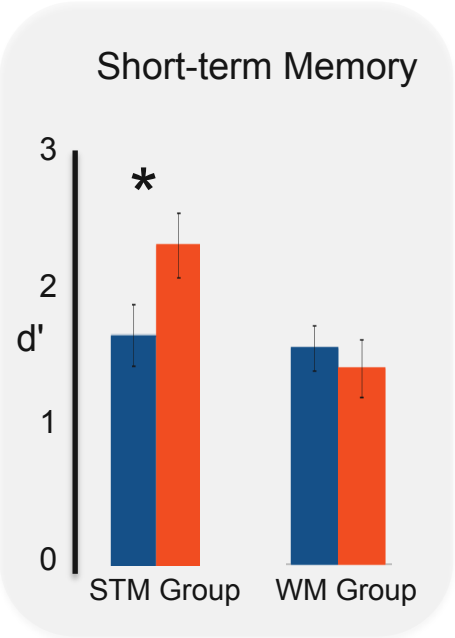


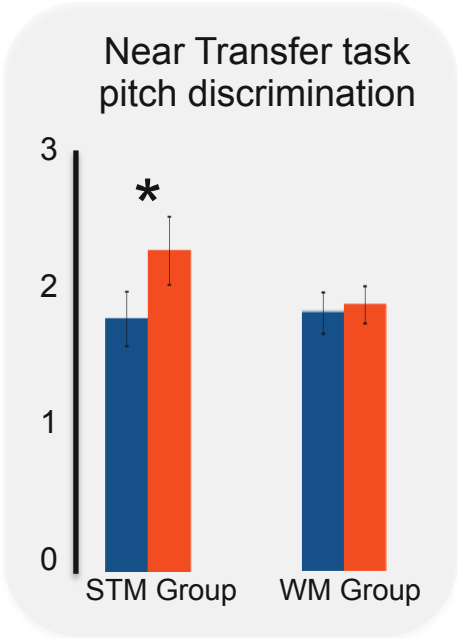
Working Memory

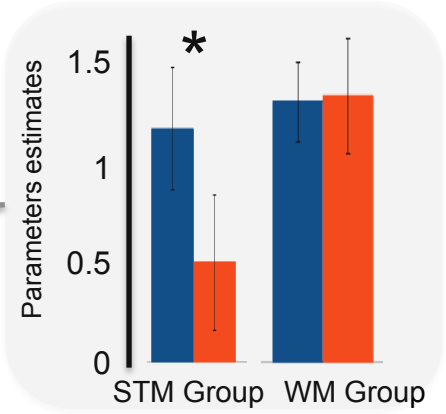


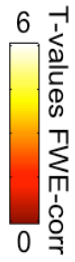
Collaboration with Ahissar Lab, Hebrew University of Jerusalem

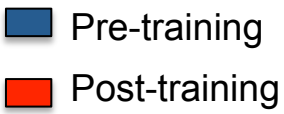
Behavioral training: Working vs Short-term memory

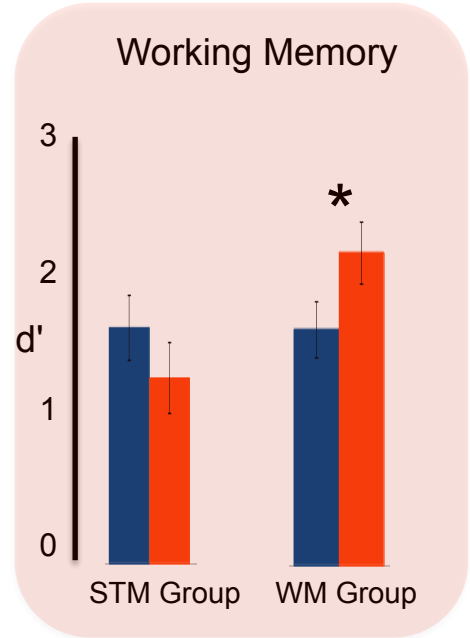


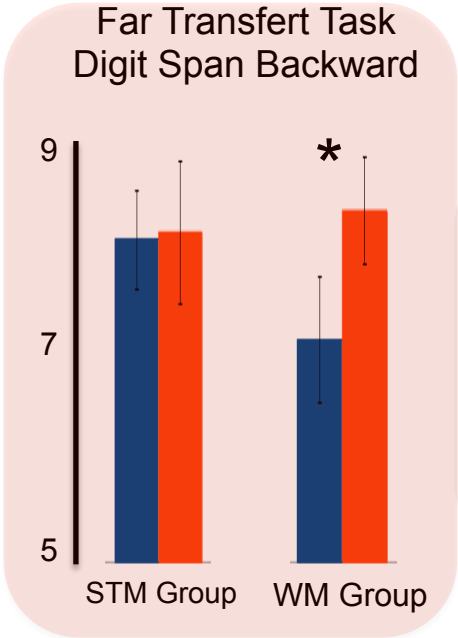


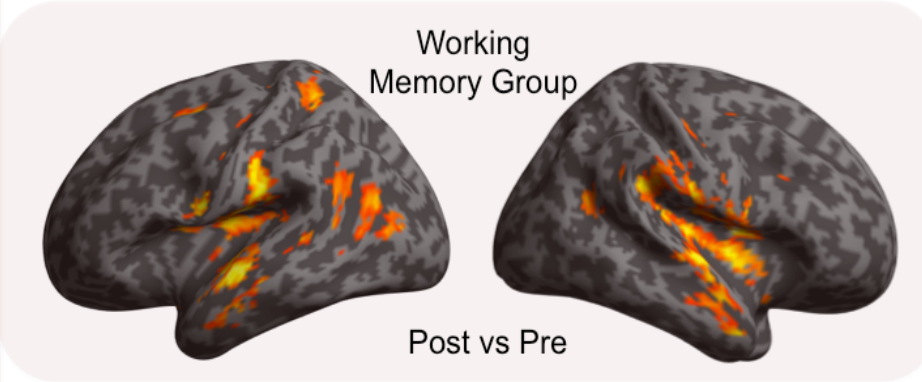












Discussion

Training Task is specific

Near transfer only for STM, far transfer for WM

STM: see Zatorre et al, (2012) decreased activity post training in the auditory cortex

WM task post –training effects in low level sensory regions

WM: Reverse Hierarchy theory (Ahissar and Hochstein 1997): Dorsal pathway sending backward signals to sensory areas to optimize stimulus representation (connectivity)

Can behavioral performance be boosted without training, via external non-invasive intervention ?

Additional Material

Boosting working memory with Behavioral Training
