EC402 - Introduction to Control Systems  
Spring 2024

Topics:

- Overview of Control Systems
- Mathematical Models of Electrical and Mechanical Systems
- State Variables
- Properties, Stability, and Performance of Feedback Control Systems
- Frequency Response Design Methods (Root Locus, Bode, Nyquist)
- Simulation using Matlab and Simulink
- Digital Control (embedded microprocessors)
- Controller design from experimental data
- Design Issues (PID, State Feedback, Observers, Robust Control)
- Numerous Examples from Many Disciplines and Current Events

Text: Interactive zyBook based on Nise, Control Systems Engineering, 8th edition
You MUST purchase and use the specific digital version
zyBook code: BUENGEC402PisanoSpring2024

Grading Policy:

Academic Misconduct

BU takes academic integrity very seriously. Academic misconduct is conduct by which a student misrepresents his or her academic accomplishments, or impedes other students’ opportunities of being judged fairly for their academic work. Knowingly allowing others to represent your work as their own is as serious an offense as submitting another’s work as your own. More information on BU's Academic Conduct Code, with examples, may be found at http://www.bu.edu/academics/policies/academic-conduct-code.

Class Material

All class material (handouts, exams, exam solutions, etc) may not be copied, posted on any website (including Chegg), or otherwise be made available to others.

Lectures may not be recorded (video and/or audio) even for your own personal use.

Failure to meet any of the above constitute plagiarism and will be considered cheating in this class. If you are not sure whether something is permitted by the course policy, ASK ME! (it’s much more awkward to explain your actions after the fact to the college disciplinary committee).
