[TP] Which of the following **has** dipole-dipole IMFs.

6% 1.  $\text{BFCl}_2$ , whose shape is **trigonal-planar**, like that of  $\text{BF}_3$

29% 2.  $\text{SCl}_2$ , which is a **bent** molecule, like  $\text{H}_2\text{O}$

15% 3.  $\text{NH}_2\text{Cl}$ , whose shape is **trigonal-pyramidal**, like that of  $\text{NH}_3$

11% 4.  $\text{OCS}$ , which is a **linear** molecule, like  $\text{CO}_2$

38% 5. All of the above

1% 6. None of the above

Lecture 12 CH131 Fall 2020  
Tuesday, October 27, 2020

- Intermolecular forces (IMF): H-bond, dipole-dipole, London
- IMFs determine relative boiling points
- Practice: Boiling points and enthalpy of vaporization

Next lecture: Vapor pressure: Liquid-vapor equilibrium; Vapor pressure and boiling point; Phase diagrams; Ch11: Solutions

BOSTON UNIVERSITY

### Dipole-dipole attraction

Molecules must be "polar"

What makes a molecule polar is **unequal sharing of electron clouds**.

Sharing tendency is proportional to **electronegativity difference**.

The greater the **difference of electronegativities**,  
the **more unequal the sharing**,  
the **more polar** the shared electron cloud.

BOSTON UNIVERSITY

### Instantaneous dipoles → London forces

When one atom encounters another closely, the electrical repulsion between the electron clouds is similar to **mismatched (off-resonance) interaction** of light and matter.

The result is the electron clouds of all atoms **always quiver slightly**.

BOSTON UNIVERSITY

9

9

Lecture 12 CH131 Fall 2020

Copyright © 2020 Dan Dill dan@bu.edu

### Instantaneous dipoles → London forces

This quivering means that electron clouds are **momentarily lopsided**, with the result that atoms have **momentary electrical dipoles**.

BOSTON UNIVERSITY

### Instantaneous dipoles → London forces

Should another atom pass nearby, the momentary dipole will **induce a dipole in the neighboring atom**.

BOSTON UNIVERSITY

### Instantaneous dipoles → London forces

The net result is that electron clouds on **neighboring atoms (and molecules)** attract one another, due to the **London force**.

BOSTON UNIVERSITY

12

12

## Relative boiling points

Boiling means particles overcome attraction to their neighbors and escape the liquid surface.

Relative boiling points reflect **relative strength of intermolecular forces** ...

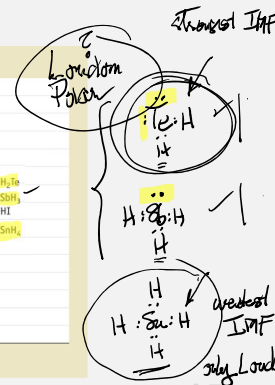

- London (dispersion) *always*
- Dipole-dipole interaction *sometimes*
- Hydrogen bonding *sometimes*

[TP] The correct order of **polarity** of  $\text{HBr}$ ,  $\text{HCl}$  and  $\text{HI}$  is (**least to most**) ...

- 5% 1.  $\text{HBr} < \text{HCl} < \text{HI}$
- 21% 2.  $\text{HBr} < \text{HI} < \text{HCl}$
- 33% 3.  $\text{HCl} < \text{HBr} < \text{HI}$
- 7% 4.  $\text{HCl} < \text{HI} < \text{HBr}$
- 6% 5.  $\text{HI} < \text{HCl} < \text{HBr}$
- 29% 6.  $\text{HI} < \text{HBr} < \text{HCl}$

*Handwritten notes:*

$\text{HI}$  least polar

$\text{HCl}$  most polar
