Element identity and atomic number Z

Number of protons = **atomic number** $Z = 19$
 Relative **atomic weight** = 39.0983
 Where does the number 39.0983 come from?

18

18

Lecture 1 CH131 Summer 1 2020 Copyright © 2020 Dan Dill dan@bu.edu

Atoms of an element come in different "flavors"

Atoms with the **same number of protons** ...
 but with **different numbers of neutrons** ...
 are **chemically the same** ...
 but have **different masses**

We call such different flavors of atoms of an element **isotopes**

39.0983 u is the average mass of the different kinds of atoms (isotopes) of K that are in a sample of K.

atomic mass unit.

Atomic mass unit u

① 1 u is exactly $\frac{1}{12}$ of the mass of just one atom of ^{12}C

② Exactly 12 g of ^{12}C atoms contains Avogadro's number, N_A , of atoms

$$N_A = 6.02214 \times 10^{23} \text{ atoms}$$

$$\text{one atom } ^{12}\text{C} = \frac{12 \text{ g}}{N_A} = 1.99265 \times 10^{-23} \text{ g}$$

$$1 \text{ u} = \frac{1}{12} \times 12 \text{ g} / N_A = \frac{\text{g}}{N_A} = 1.66054 \times 10^{-24} \text{ g}$$

20

20

Lecture 1 CH131 Summer 1 2020 Copyright © 2020 Dan Dill dan@bu.edu

Atomic mass unit u

1 u defined to be exactly $(1/12)$ mass of 1 atom of ^{12}C

Exactly 12 g of ^{12}C contains $N_A = 6.02214 \times 10^{23}$ atoms

Therefore, the mass of one ^{12}C atom is ...

$$12 \text{ g} / N_A = 1.99265 \times 10^{-23} \text{ g}$$

And so, $1 \text{ u} = \dots$

$$(1/12) \times 1.99265 \times 10^{-23} \text{ g} = 1.66054 \times 10^{-24} \text{ g}$$
