## Real gases

While the **ideal gas** law is the **same for every gas**, there are **two effects** in all **real gases** that are important at **high gas densities** (due to **temperatures close to condensation** or **very high pressures**).

8

8

## Real gases

The first effect is due to **gas particles** themselves **taking up space**.

For example, we have seen that at 100°C, the density of  $\text{H}_2\text{O}(g)$  is  $0.0327 \frac{\text{mol}}{\text{L}}$  || and the density of  $\text{H}_2\text{O}(l)$  is  $0.958 \frac{\text{g}}{\text{mL}}$  ||

[TP] The density of  $\text{H}_2\text{O}(g)$  is  $0.0327 \frac{\text{mol}}{\text{L}}$  and the density of  $\text{H}_2\text{O}(l)$  is  $0.958 \frac{\text{g}}{\text{mL}}$ . Calculate how much space is taken up by the water molecules in 1 L of gaseous water at 100°C.

|     |    |          |
|-----|----|----------|
| 6%  | 1. | 0.0001 L |
| 44% | 2. | 0.0006 L |
| 38% | 3. | 0.001 L  |
| 6%  | 4. | 0.006 L  |
| 6%  | 5. | 0.01 L   |
| 0%  | 6. | 0.06     |

11

**Real gases**

The density of  $\text{H}_2\text{O}(g)$  is  $0.0327 \frac{\text{mol}}{\text{L}}$  and the density of  $\text{H}_2\text{O}(l)$  is  $0.958 \frac{\text{g}}{\text{mL}}$  so the volume taken up by the gaseous water as a liquid would be

$$V_{\text{H}_2\text{O}(l)} = 0.0327 \frac{\text{mol}}{\text{mol}} \times \frac{18.0 \text{ g}}{\text{mol}} \times \frac{\text{mL}}{0.958 \text{ g}} \times \frac{\text{L}}{1000 \text{ mL}} = 0.000614 \text{ L}$$

This means that

$$\frac{0.000614 \text{ L}}{1 \text{ L}} \times 100\% = 0.06\%$$

of the 1-L volume is taken up by the water molecules,

$$1 \text{ L} = V_{\text{ideal}} + V_{\text{H}_2\text{O}(l)}$$

1 L contains 0.0006 L of particles remainder is empty space

100°C

1.8/mL

1 L container

BOSTON UNIVERSITY

12

12

**Real gases**

More generally, the volume of the container is expressed as empty space ( $V_{\text{ideal}}$ ) plus that taken up by the molecules themselves,

$$V = V_{\text{ideal}} + bn$$

Here the parameter van der Waals  $b$  is the volume taken up by one mole of the molecules of the substance.

$b$  = volume of one mole particles

BOSTON UNIVERSITY

13

13

**Real gases**

$P \uparrow \quad V \downarrow$

$$V = V_{\text{ideal}} + bn$$

At high pressures, the volume of the molecules of a gas ( $bn$ ) is no longer negligible relative to the volume of the container ( $V$ ).

BOSTON UNIVERSITY

14

14

**Real gases**

The second effect is due to attraction of the gas particles for one another.

This attraction lessens the impact of each particle with the container walls and so reduces the pressure.

BOSTON UNIVERSITY

15

15

## Real gases

The reduction in pressure is proportional to the number of particles hitting the wall and the number of neighboring particles lessening each particle's impact with the wall,

$$P = P_{\text{ideal}} - a \left( \frac{n}{V} \right)^2$$

The parameter van der Waals  $a$  is a measure of the intermolecular attraction exerted between particles of the gas.

16

16

## Real gases

The ideal gas law relates  $P_{\text{ideal}}$  and  $V_{\text{ideal}}$ ,  $P_{\text{ideal}}V_{\text{ideal}} = nRT$ .

Using the expressions  $V = V_{\text{ideal}} + bn$  and  $P = P_{\text{ideal}} - a \left( \frac{n}{V} \right)^2$ , we can rewrite the ideal gas law in terms of actual pressure and the actual container volume,

$$\left( P + a \left( \frac{n}{V} \right)^2 \right) (V - bn) = nRT$$

This is known as the van der Waals equation.

17

17

## Real gases

Computations with the van der Waals equation are usually done by rearranging it for the observed pressure,

$$P = \frac{nRT}{V - bn} - a \left( \frac{n}{V} \right)^2$$

and using tabulated values of van der Waals  $a$  and  $b$ .

| Gas            | Formula                       | $a$ (L <sup>2</sup> ·bar·mol <sup>-2</sup> ) | $b$ (L·mol <sup>-1</sup> ) |

## Working with the van der Waals equation

$$P = \frac{nRT}{v-bn} - a\left(\frac{n}{v}\right)^2 \text{ and } R = 0.08314 \text{ L bar/(K mol)}$$

In general, the effect of  $b$  is muted at **low  $T$**  and so the effect of  **$a$  dominates** there, while for **high  $T$**  the effect of  **$b$  dominates**.

For 3.00 mol of  $\text{Cl}_2$  confined in 4.00 L, here is  $\frac{P}{P_{\text{ideal}}} - 1$  versus  $T$ .

26

26

Lecture 7 CH131 Summer 1 2020

Copyright © 2020 Dan Dill dan@bu.edu

## Working with the van der Waals equation

$$P = \frac{nRT}{v-bn} - a\left(\frac{n}{v}\right)^2 \text{ and } R = 0.08314 \text{ L bar/(L mol)}$$

For  $\text{Cl}_2$ ,  $a = 6.58 \text{ bar L}^2/\text{mol}^2$  and  $b = 0.0562 \text{ L/mol}$ . What is the observed and ideal pressures of 8.00 mol of  $\text{Cl}_2$  confined in 4.00 L at **27 °C**? Use

$$P_{\text{ideal}} = \frac{nRT}{v} = 49.9 \text{ bar}$$

$$P = \frac{nRT}{v-bn} - a\left(\frac{n}{v}\right)^2 = 56.2 \text{ bar} - 26.3 \text{ bar} = 29.9 \text{ bar}$$

Since the observed pressure is smaller than the ideal pressure, the effect of  $a$  is more important than  $b$  at 27 °C

27

27

## Problem 7e:9.49 and 8e:9.51

$$a = 3.640 \text{ L}^2\text{bar/mol}^2$$

$$b = 0.04267 \text{ L/mol}$$

49. Using (a) the ideal gas law and (b) the van der Waals equation, calculate the pressure exerted by 50.0 g carbon dioxide in a 1.00-L vessel at 25°C. Do attractive or repulsive forces dominate?

BOSTON UNIVERSITY

28

28

## Why intermolecular forces (IMF)?

We know from the van der Waals equation that gases **attract one another**.

Indeed, if they did not, they would not liquify.

BOSTON UNIVERSITY

29

29

## Intermolecular forces: electrical stickiness!

Molecules attract one another, because of the attraction of opposite electrical charges.

The most specific and **strongest** IMF is "hydrogen bonding":  $X-H \cdots Y$

More common and of **intermediate strength** IMF is "dipole-dipole attraction":

Always present and **weakest** IMF is "temporary dipole attraction" ("London force"):

### Dipole-dipole attraction

Molecules must be "polar"

What makes a molecule polar is **unequal sharing of electron clouds**.

Sharing tendency is proportional to **electronegativity difference**.

The greater the **difference of electronegativities**, the **more unequal the sharing**, the **more polar** the shared electron cloud.

BOSTON UNIVERSITY

### Instantaneous dipoles → London forces

When one atom encounters another closely, the electrical repulsion between the electron clouds is similar to **mismatched (off-resonance) interaction** of light and matter.

The result is the electron clouds of all atoms **always quiver slightly**.

BOSTON UNIVERSITY

40

Lecture 7 CH131 Summer 1 2020

Copyright © 2020 Dan Dill dan@bu.edu

## Instantaneous dipoles → London forces

This quivering means that electron clouds are **momentarily lopsided**, with the result that atoms have **momentary electrical dipoles**.

BOSTON  
UNIVERSITY

41

41

Lecture 7 CH131 Summer 1 2020

Copyright © 2020 Dan Dill dan@bu.edu

## Instantaneous dipoles → London forces

Should another atom pass nearby, the momentary dipole will **induce a dipole in the neighboring atom**.
