

# Impacts of Closure Periods on BU CO<sub>2</sub> Emissions and Local CO<sub>2</sub> Concentrations

## Amid coronavirus pandemic, air pollution declines in Boston and elsewhere

Air pollution has dropped significantly as travel, economic activity ground to a halt

By [David Abel](#) Globe Staff, Updated March 28, 2020, 4:47 p.m.

# What are COVID shutdowns doing to CO<sub>2</sub> emission?

## Coronavirus could trigger the **largest ever annual fall** in CO<sub>2</sub> emissions

Pre-crisis GDP estimates suggested CO<sub>2</sub> would rise by more than 1% in 2020 (470MtCO<sub>2</sub>)

- **Early, tentative** estimate suggests declines of 6-8% in emissions relative to 2019, largest ever annual fall in CO<sub>2</sub> emissions.
- Analyses are actively ongoing, China's emissions have already rebounded and overshoot pre-COVID

GLOBAL EMISSIONS

Analysis: Coronavirus set to cause largest ever annual fall in CO<sub>2</sub> emissions

CB

# How about Boston?

While many office jobs are still remote, lots of emissions related activity has returned to near pre-pandemic levels

Location 4165: 16/95, 10 miles from BOS

# Daily, seasonal, and yearly trends are visible in the record

Heating use is declining while biology is starting to take up CO<sub>2</sub>

Gately & Hutyra 2017

# Energy use data is complicated

The electricity grid has 'greened' and BU energy profile has shifted over time. Weather, retrofits, new buildings, & campus growth are embedded throughout this signal.

**CO<sub>2</sub> data was additively decomposed**

**Decomposition of additive time series**

## Many episodes of campus closure

| Closure            | Percent Closed | Number of Closures<br>(1/2014-8/2020) |
|--------------------|----------------|---------------------------------------|
| Corona Virus       | 100            | 170                                   |
| Holiday            | 100            | 46                                    |
| Winter Holiday     | 100            | 62                                    |
| Brookline Snow Day | 50             | 10                                    |
| Winter Break       | 50             | 128                                   |
| Spring Break       | 40             | 63                                    |
| Summer             | 40             | 226                                   |
| Thanksgiving Break | 40             | 35                                    |
| Summer Classes     | 20             | 483                                   |
| Finals             | 5              | 67                                    |
| Study Period       | 5              | 49                                    |

## Analysis is at the early stages...

- Data is for weekday daytime hours for all seasons
- Mean and 95% confidence intervals are pictured
- Initial data is suggestive of a negative correlation between percent closed and CO<sub>2</sub> concentration, but the data is skewed, with wide confidence intervals

# Lessons and next steps

- The Boston University climate action plan has a goal to reach net zero direct emissions by 2040
- University energy use data acts as a baseline, and includes early efforts by the university to alter their energy sources
- Through further analysis of the CO<sub>2</sub> concentration and closure data, we hope to uncover opportunities for future emissions reductions
