MODULE 4: LEDs

SUMMER CHALLENGE Electrical Engineering: Smart Lighting

Prachi Shukla PhD Candidate Boston University prachis@bu.edu

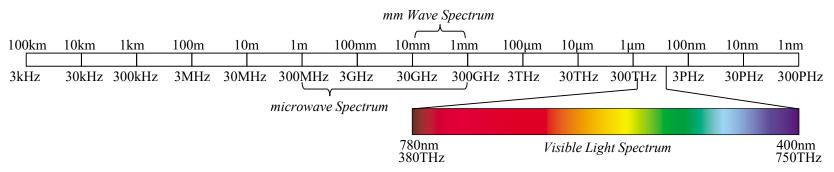

Overview

- From "Lighting" to Smart Lighting
- What is a Diode?
- LEDs!
- Electrical Power
- LED Drivers

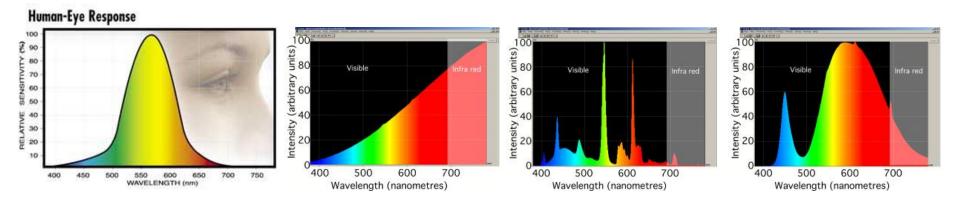

Lighting & Color Science

Visible Light is a form of electromagnetic radiation

- The human eye responds to the visible light spectrum
- White light is the presence of all colors

Smart Lighting

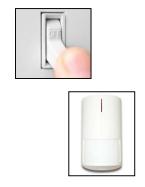

- In what ways can light be better?
 - Energy Efficiency

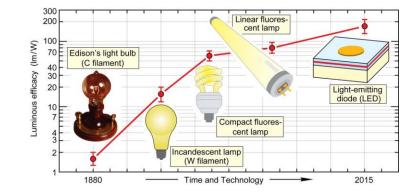

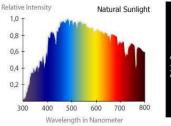

Healthy Lighting

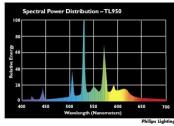

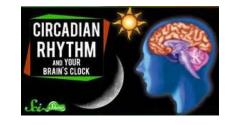

Productivity (Data access)

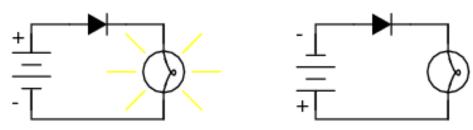

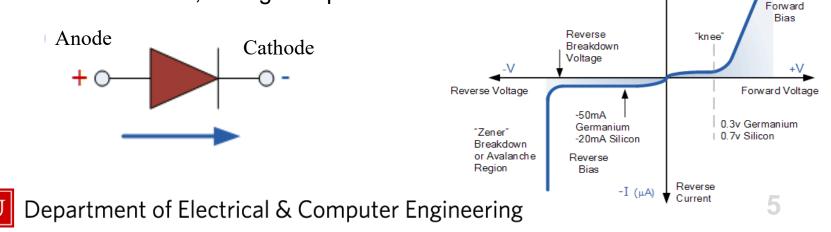

What is a diode?

 A device that allows current to flow in one direction; always has polarity (e.g., LED)

- Forward Bias Voltage
 - For current to flow, diodes require a turn-on voltage (i.e., forward bias voltage)
 - In an *ideal* diode, voltage drop remains constant

Kirchhoff's Voltage Law

• The algebraic sum of all voltages in a loop must equal 0

$$V_0 + (-V_1) + (-V_2) = 0$$

• Once the diode reaches the turn on voltage, V_R increases with V_S

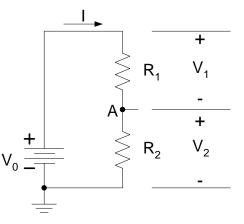

+

 V_S

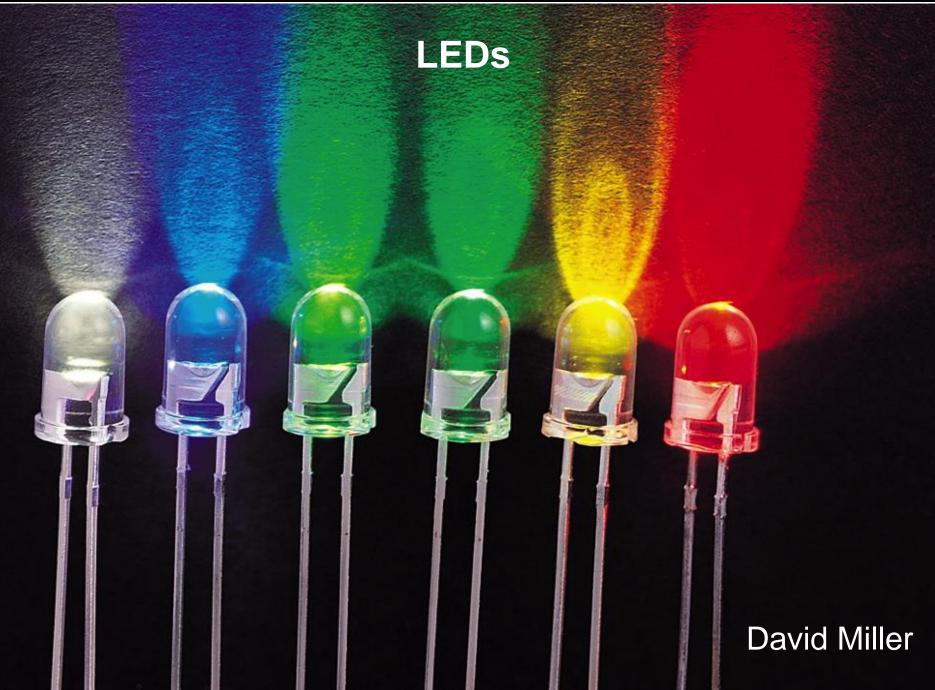

• Current through the circuit increases with increase in V_R

$$V_S + (-V_D) + (-V_R) = 0$$

 V_D

How Do LEDs Work?

LED Materials

- Semiconducting materials: Resistance levels between those of a conductor and an insulator
- Current can only flow in one direction
- Passing through the LED, electrons lose energy
 - Lost energy creates photons
 - Photons have discrete wavelength related to band-gap
- Band-gap width and energy
 - The wider the band-gap, the greater the energy of the photon released
 - Specialized materials & processes required to achieve wide band-gap
 - Planck's Relation:

$$E = \frac{hc}{l}$$

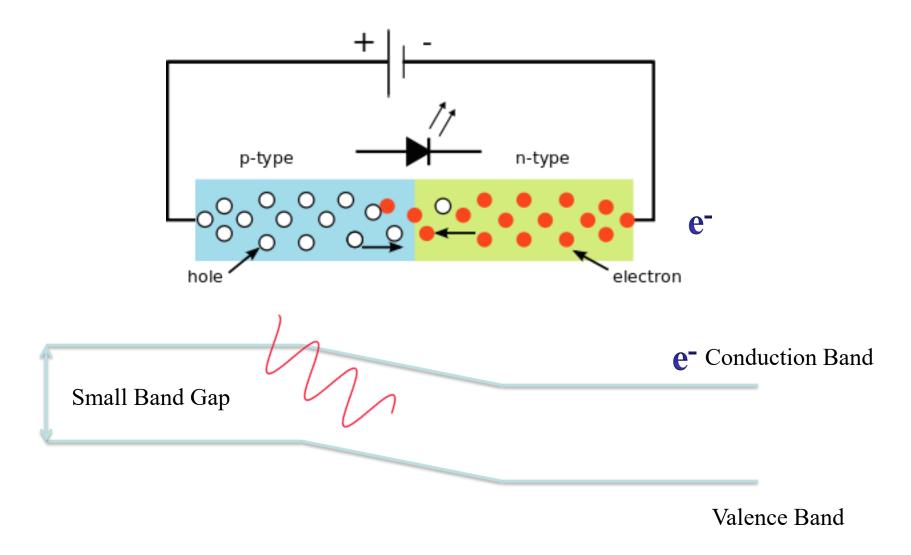

E: Energy

- h: planck constant
- c: speed of light
- λ : wavelength

BU

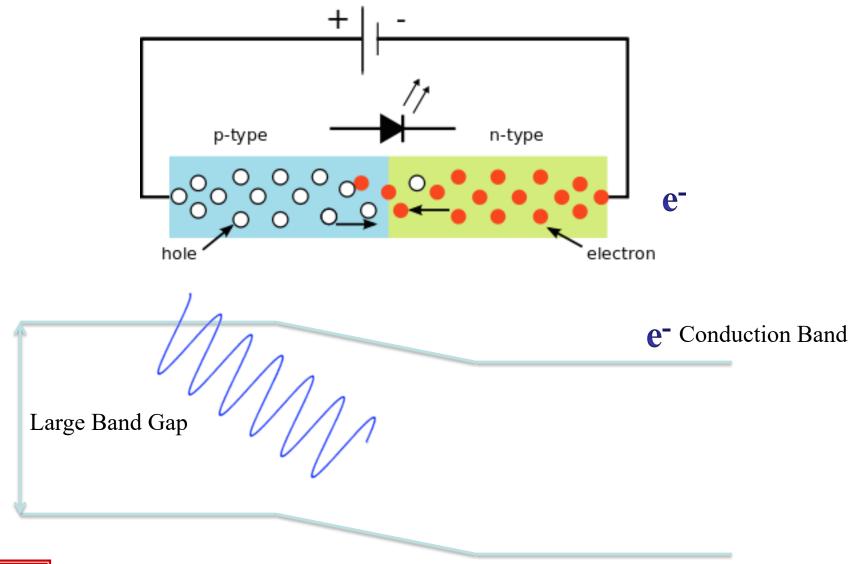

Department of Electrical & Computer Engineering

Small Band Gap: Low Energy Red Light

Large Band Gap: High Energy Blue Light

J Department of Electrical & Computer Engineering

Valence Band

Experiment I

- LED circuit
- Determining the turn-on voltage

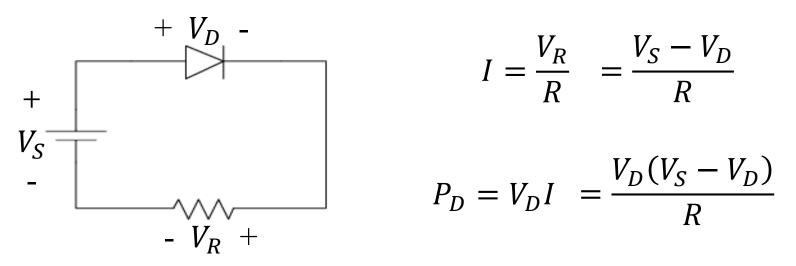

Electrical Power

Power is the rate at which energy is consumed.

P = VI This is another one of those important equations...

- Power is measured in Watts [W] or [J/s]
- Energy sources (such as batteries) produce power while the *load* of the circuit absorbs power.

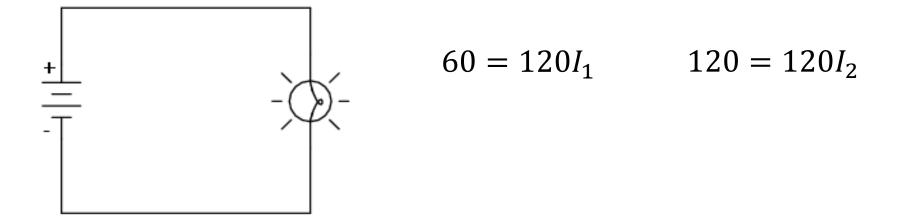

Department of Electrical & Computer Engineering

Electrical Power

V = IR

- Combining the previous equation with Ohm's
- Law: $P = VI = I^2 R = \frac{V^2}{R}$
- Consider a 60W incandescent attached to a 120V source
 - How does current change if you replace the 60W bulb with 120W bulb?

Experiment II

- LED Drivers
- Power Consumption

Recap

What did you
