[TP] Do we get the same amount of energy back from **making bonds between an ion and water molecules**, as it took to **break the ionic bonds** holding an ion in the solid?

25% 1. The energy is the same
25% 2. More energy to break ion bonds in solid
25% 3. More energy from making ion-water bonds
25% 4. We don't know

BOSTON UNIVERSITY Response Counter 10 1

Lecture 11 CH102 A1 (MWF 9:05 am)
Wednesday, February 14, 2018

Begin ch12: Solutions and their behavior

- Enthalpy change of solution: Ionic Solutes
- $\Delta_{\text{latt}}H$, $\Delta_{\text{aq}}H$ and $\Delta_{\text{soln}}H$
- Predicting relative values of $\Delta_{\text{latt}}H$ and $\Delta_{\text{aq}}H$

Next: Complete ch12: Predicting relative values of $\Delta_{\text{latt}}H$ and $\Delta_{\text{aq}}H$; review: Colligative properties; begin ch13: Dynamic chemical equilibrium

CH101 lecture 18: About "NaCl(aq)", etc.

Ionic solids dissolve by their ions being surrounded by water.

For example, $\text{NaCl}(s) \rightarrow \text{Na}^+(aq) + \text{Cl}^-(aq)$

BOSTON UNIVERSITY 10

CH101 lecture 18: About "NaCl(aq)", etc.

The collection of hydrated ions is sometimes represented as "salt(aq)".

For example, $\text{Na}^+(aq) + \text{Cl}^-(aq)$ is abbreviated as $\text{NaCl}(aq)$

However, **this is wrong**, since chemically, **salt(aq) does not exist**.

It is only **an abbreviation for the hydrated ions**, e.g., $\text{Na}^+(aq) + \text{Cl}^-(aq)$

Since salt(aq) does not exist, in this course **please do not use it!**
