[TP] What happens to $\ln(k)$ as T increases to infinity?

25% 1. $\ln(k) = 0$
25% 2. $\ln(k) = 1$
25% 3. $\ln(k) = \infty$
25% 4. $\ln(k) = \text{something else}$

First law, second law, equilibrium, and kinetics

$$\lim_{T \rightarrow \infty} \ln(K) = \frac{\Delta S^\circ}{R} = \lim_{T \rightarrow \infty} \ln\left(\frac{k_{\text{for}}}{k_{\text{rev}}}\right) = \ln\left(\frac{A_{\text{for}}}{A_{\text{rev}}}\right)$$

What is the significance of this result?

 12

Lecture 38 CH102 A2 (MWF 11:15 am) Spring 2018 Copyright © 2018 Dan Dill dan@bu.edu

First law, second law, equilibrium, and kinetics

$$\lim_{T \rightarrow \infty} \ln(K) = \frac{\Delta S^\circ}{R} = \lim_{T \rightarrow \infty} \ln\left(\frac{k_{\text{for}}}{k_{\text{rev}}}\right) = \ln\left(\frac{A_{\text{for}}}{A_{\text{rev}}}\right)$$

What is the significance of this result?

First, at very high T , K only depends on $\Delta S^\circ = \Delta S^\circ_{\text{sys}}$.

Why is this?

It is because at very high T , heat flow **can no longer change** entropy of the surroundings,

$$\lim_{T \rightarrow \infty} \Delta S_{\text{sur}} = -\lim_{T \rightarrow \infty} \frac{\Delta H^\circ_{\text{sys}}}{T} = -\frac{\Delta H^\circ_{\text{sys}}}{\infty} = 0$$

First law, second law, equilibrium, and kinetics

$$\lim_{T \rightarrow \infty} \ln(K) = \frac{\Delta S^\circ}{R} = \lim_{T \rightarrow \infty} \ln\left(\frac{k_{for}}{k_{rev}}\right) = \ln\left(\frac{A_{for}}{A_{rev}}\right)$$

What is the significance of this result?

Second, since the entropy change of the system can be expressed as

$$\frac{\Delta S^\circ}{R} = \ln\left(\frac{W_{products}}{W_{reactants}}\right)$$

at very high T , the ratio of the Arrhenius factors is related to the ratio of the number arrangements or reactants and products,

$$\lim_{T \rightarrow \infty} \ln(K) = \frac{\Delta S^\circ}{R} = \ln\left(\frac{W_{products}}{W_{reactants}}\right) = \ln\left(\frac{A_{for}}{A_{rev}}\right)$$

First law, second law, equilibrium, and kinetics

$$\text{Rate constant: } \ln(k) = -\left(\frac{E_a}{R}\right)\frac{1}{T} + \ln(A)$$

$$\text{Equilibrium constant: } \ln(K) = -\left(\frac{\Delta H^\circ}{R}\right)\frac{1}{T} + \frac{\Delta S^\circ}{R}$$

What's the connection between enthalpy change and activation energies?

 $K = k_{for}/k_{rev}$ and so ...

$$\ln(K) = -\frac{\Delta H^\circ}{R}\frac{1}{T} + \frac{\Delta S^\circ}{R} = \ln\left(\frac{k_{for}}{k_{rev}}\right) = -\frac{(E_{a,for} - E_{a,rev})}{R}\frac{1}{T} + \ln\left(\frac{A_{for}}{A_{rev}}\right)$$

and therefore, ...

$$\Delta H^\circ = E_{a,for} - E_{a,rev}$$

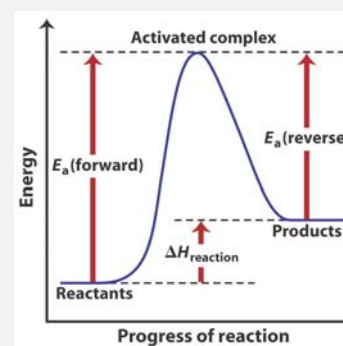

16

[Group Quiz] We've established that as T increases to infinity,

$$\ln(K) = \ln\left(\frac{k_{\text{for}}}{k_{\text{rev}}}\right) = \ln\left(\frac{A_{\text{for}}}{A_{\text{rev}}}\right)$$

Therefore at $T = \infty$, the equilibrium constant must depend on the ...

- 0% 1. entropy change of the surroundings
- 0% 2. entropy change of the system
- 0% 3. enthalpy change of the surroundings
- 0% 4. enthalpy change of the system
- 0% 5. (1) and (2) are correct
- 0% 6. (2) and (4) are correct
- 0% 7. Further information needed
