[TP] A container of volume V is filled with a gas at 20 °C. If V is **decreased** (while keeping T **constant**), the pressure P exerted by the gas on the walls of the container goes up ($P = nRT/V$). **Why?**

- 17% 1. The particles move faster
- 17% 2. The particles move slower
- 17% 3. The particles hit the walls harder
- 17% 4. The particles hit the walls less hard
- 17% 5. The particles hit the walls more often
- 17% 6. The particles hit the walls less often

Kinetic-molecular theory of gases

The expression for pressure,

$$P = \frac{nM}{V} u_{\text{avg}}^2 \text{ (one dimension)}$$

assumes the particle **moves in just one dimension**, back and forth between opposite walls, say the walls perpendicular to the x axis.

A more detailed treatment that takes into account motion in all **three dimensions** shows that the pressure on any one wall is **only 1/3 as great**,

$$P = \frac{nM}{3V} u_{\text{avg}}^2 \text{ (three dimensions)}$$

3

Calculation of molecular speeds

We now have two expressions for pressure:

The **microscopic** expression $P = \frac{nMu_{\text{avg}}^2}{3} / V$

and the **macroscopic** expression $P = nRT/V$

Comparing these, we get that $\frac{Mu_{\text{avg}}^2}{3} = RT \dots$

and so that the average squared speed is $u_{\text{avg}}^2 = \frac{3RT}{M}$

Calculation of molecular speeds

$$u_{\text{avg}}^2 = \frac{3RT}{M}$$

is the connection between...

microscopic **motion**, quantified as u_{avg}^2 , and ...

the macroscopic concept **temperature**, T , and molar **mass**, M .

The square **root** of the **mean** (average) **squared** speed is the **rms speed** ...

$$u_{\text{rms}} = \sqrt{u_{\text{avg}}^2} = \sqrt{\frac{3RT}{M}}$$

Practice with particle picture of gases

Let's consider some questions to help us develop a **particle-level understanding** of why gases behave the way they do.

BOSTON UNIVERSITY 6

[TP] When more particles are added to the **same** V at the **same** T , P goes up ($P = nRT/V$). Why?

- 25% 1. The particles move faster
- 25% 2. The particles move slower
- 25% 3. More particles hit the walls in a given time
- 25% 4. Fewer particles hit the wall in a given time

12

[TP] When a gas is **heated**, if the P is to remain **constant**, then volume V must go up ($V = nRT/P$). Why?

- 25% 1. The particles move faster
- 25% 2. The particles move slower
- 25% 3. The distance travelled between collisions with the walls must increase
- 25% 4. The distance travelled between collisions with the walls must decrease

[TP] Two 1 L containers, A and B, each contain equal numbers of particles at 20 °C. The particles of gas in A are **twice as heavy** as those in B, $m_A = 2 m_B$. Therefore ...

- 0% 1. particles of gas A move faster than those of gas B
- 0% 2. particles of gas A move slower than those of gas B
- 0% 3. particles of gas A move at the same average speed as those of gas B

[TP] Equal amounts of gases A and B are in a **single container**. The mass of a molecule of gas in A is **twice** that of the gas in B, $m_A = 2 m_B$. The container is pierced with a hole **0.003 mm** in diameter.

When 5 minutes has elapsed after the piercing, the container will contain ...

- 0% 1. more A than B
- 0% 2. equal amounts of each gas
- 0% 3. less A than B
- 0% 4. Further information needed

[Quiz] Two 1 L containers, A and B, each contain equal numbers of particles at 20 °C. The particles of gas in A are **twice as heavy** as those in B, $m_A = 2 m_B$. What are the relative pressures in the two containers?

- 0% 1. Pressure of A is half the pressure of B
 0% 2. Pressure of A equals the pressure of B
 0% 3. Pressure of A is twice the pressure of B
 0% 4. Pressure of A is four times the pressure of B

17

Practice with particle picture of gases

Two 1 L containers, A and B, each contain equal numbers of particles at 20 °C. The particles of gas in A are **twice as heavy** as those in B, $m_A = 2 m_B$. The pressure in the two containers is **the same**.

How can this be?

$$P = \frac{nM}{3V} u_{\text{avg}}^2 = \frac{nM}{3V} \frac{3RT}{M} = \frac{nRT}{V}$$

Pressure depends on both speed and mass, but in opposite ways that **cancel one another**.

Greater mass contributes **greater momentum**.

Greater mass means **lower speed** and so **offsets greater momentum**

Units of pressure and of the gas constant R

In CH101 Fall 2018 (lecture 14) we discussed units of pressure

$$1 \text{ Pa} = \frac{\text{force}}{\text{area}} = 1 \frac{\text{kg m/s}^2}{\text{m}^2} = 1 \frac{\text{kg m}^2/\text{s}^2}{\text{m}^3} = 1 \frac{\text{J}}{\text{m}^3}$$

$$1 \text{ bar} = 100 \text{ kPa} = 100000 \text{ Pa (exactly)}$$

$$1 \text{ atm} = 101.325 \text{ kPa} = 101325 \text{ Pa (exactly)}$$

20

Lecture 5 CH102 A2 (MWF 11:15 am) Spring 2019

Copyright © 2019 Dan Dill dan@bu.edu

Pressure = Force/Area

$$\text{Pa} = \text{J/m}^3$$

$$1 \text{ atm} = 101325 \text{ Pa}$$

$$\text{m}^3 = 1000 \text{ L}$$

Use dimensional analysis to convert $R = 8.314 \text{ J} / (\text{K mol})$ to $\text{L atm} / (\text{K mol})$.
