A gas law for “real” gases: van der Waals equation

We know the ideal gas law $pV = nRT$ where p does not account for inter-particle attractions ...

$$p = p_{\text{ideal}} = p_{\text{observed}} + a \left(\frac{n}{V_{\text{container}}} \right)^2$$

and V does not account for particle volume ...

$$V = V_{\text{empty}} = V_{\text{container}} - bn$$

Combine these two expressions into an equation relating p_{observed} , $V_{\text{container}}$, and T .

A gas law for “real” gases: van der Waals equation

We know the ideal gas law $pV = nRT$ where p does not account for inter-particle attractions and V does not account for particle volume ...

$$p = p_{\text{ideal}} = p_{\text{observed}} + a \left(\frac{n}{V_{\text{container}}} \right)^2$$

$$V = V_{\text{empty}} = V_{\text{container}} - bn$$

$$p_{\text{ideal}} V_{\text{empty}} = \left\{ p_{\text{observed}} + a \left(\frac{n}{V_{\text{container}}} \right)^2 \right\} (V_{\text{container}} - bn) = nRT$$

This is known as the van der Waals equation

Working with the van der Waals equation

In terms of $p = p_{\text{observed}}$ and $V = V_{\text{container}}$, the van der Waals equation is

$$\left\{ p + a \left(\frac{n}{V} \right)^2 \right\} (V - bn) = nRT$$

For calculations, rearrange this to express the observed p in terms of $n, V, T, a,$ and b .

$$p = \frac{nRT}{V - bn} - a \left(\frac{n}{V} \right)^2$$

Working with the van der Waals equation

$$p = \frac{nRT}{v-bn} - a \left(\frac{n}{v}\right)^2 \text{ and } R = 0.08314 \text{ L bar/(K mol)}$$

For Cl_2 , $a = 6.58 \text{ bar L}^2/\text{mol}^2$ and $b = 0.0562 \text{ L/mol}$. What are the **ideal** and **observed** pressures of 3.00 mol of Cl_2 confined in 4.00 L at **500. K**?

$$p_{\text{ideal}} = \frac{nRT}{v} = 31.3 \text{ bar (confirm yourself)}$$

$$p = \frac{nRT}{v-bn} - a \left(\frac{n}{v}\right)^2 = 32.5 \text{ bar} - 3.7 \text{ bar} = 28.8 \text{ bar (confirm yourself)}$$

Since the observed pressure is smaller than the ideal pressure, the **effect of a is more important** than b at 500. K.
