Lecture 13 CH102 A1 (MWF 9:05 am)
 Wednesday, February 20, 2019

- Review: Reaction quotient, Q , spontaneity, and equilibrium
- Predicting direction of change
- Q depends on how a reaction is written
- Knowing K **does not** fix individual concentrations.

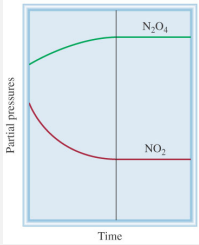

Next: Disturbing equilibrium (Le Chatelier); Begin ch14: Acid-base equilibria in aqueous solutions

[TP] The figure shows how the partial pressures of the N_2O_4 and NO_2 **change with time** due to the chemical reaction
 $N_2O_4 \rightarrow 2 NO_2$
 for **certain initial conditions** (far left). At these initial conditions, the following is known about the chemical reaction.

25% 1. It is **spontaneous**
 25% 2. It is **at equilibrium**
 25% 3. It is **non-spontaneous**
 25% 4. Its spontaneity is **not known** without further information

Q versus K is the key to assessing spontaneity

If $Q < K$, product must form to get to equilibrium,
 so **spontaneous**

If $Q > K$, reactants must form to get to equilibrium,
 so **nonspontaneous**

If $Q = K$, no change in amounts of reactants and products,
 so **equilibrium**

So, Q/K is the key quantity to monitor.

Q depends on how a reaction is written

At a certain time, the value of the reaction quotient for the reaction
 $2 A + B \rightleftharpoons 2 C$
 is $Q_1 = 4.0$.
 At the same time, what would be the value of Q be for the reaction
 $4 A + 2 B \rightleftharpoons 4 C$?

$$Q_4 = \frac{(C)^4}{(A)^4(B)^2} = Q_1^2 = 16$$

Q depends on how a reaction is written

At a certain time, here are the values of the reaction quotients for two different reactions,

$$2 A \rightleftharpoons B, \quad Q_5 = \frac{(B)}{(A)^2} = 2$$

$$C \rightleftharpoons 3 D, \quad Q_6 = \frac{(D)^3}{(C)} = 5$$

At the same time, what would be the value of Q be for the reaction

$$Q_7 = \frac{(B)(D)^3}{(A)^2(C)} = Q_5 \times Q_6 = 10$$

Chapter 13 equilibrium calculations

Pages 505—507 illustrate how to calculate equilibrium concentrations by solving polynomial (quadratic, etc.) equations for the change in concentration.

This is doable but can be time consuming.

We will not need to use this method.

Rather, in chapter 14, we will learn to use an **approximate method** that is broadly applicable to aqueous **acid-base equilibria**.

Here, in chapter 13, we will illustrate equilibration by providing the equilibrium values.

Equilibration examples

Essential lesson:
 Knowing K does not fix individual equilibrium concentrations.

Let's see how this works for

$$H_2(g) + I_2(g) \rightleftharpoons 2 HI(g), K = 33$$

for three different sets of **initial concentrations**
